KLDiscovery Hiring Team

Director of Product - Client Services Tech Enablement

KLDiscovery is not hiring this role to manage three unrelated roadmaps. You are creating a product leader for the operating system behind every matter: the workflows that move work, the intelligence that detects divergence before it becomes a client problem, and the portal that converts internal execution into client trust.

That mandate is unusually close to the work I have repeatedly done at the seams between operations, engineering, quality, customer service, data, and emerging technology. At Vape-Jet, I lead an AI-first operating transformation across production, purchasing, quality, customer success, support, engineering issue flow, ERP/Odoo, Jira, HubSpot, Slack, and telemetry in a software-enabled robotics environment. The job is not to add AI terminology to the process. It is to make work visible, define ownership, instrument decisions, reduce handoff friction, and keep customer commitments connected to operational truth.

Earlier, I led high-reliability engineering, manufacturing, quality, and customer-delivery systems at Compunetics; launched customer-backward, high-velocity operating mechanisms at Amazon; and built a remote regional operation at Cardinal Building Products while modernizing CRM, logistics, fulfillment, and digital workflows. Through DudeWorth, I have also built and advised AI-readiness and agentic workflow patterns that combine structured context, retrieval, LLMs, human judgment, escalation, decision records, evaluation, and governance.

My thesis for KLDiscovery is a **Matter State Contract**: one shared operational record defining expected state, observed state, evidence, owner, SLA, authority, and client-safe visibility. Workflow orchestration acts on that contract. AI tests for divergence. People govern exceptions. The client portal publishes the same trusted state rather than reconstructing status after the fact. The candidate vision at <https://russelldudek.github.io/KLDiscovery/> demonstrates the model, its metrics, and a 90-day path to pilot one closed loop.

I would enter with respect for the eDiscovery domain and learn it directly from Client Services, Operations, legal technologists, the AI Architect, Engineering, and matter teams. I would bring immediate value in workflow productization, high-consequence operating controls, AI-enabled system design, prototyping, cross-functional leadership, and the discipline to connect product promises to the work actually happening.

I welcome the opportunity to discuss where matter state becomes hardest to see today-and how KLDiscovery can turn that friction into a durable product advantage.

Sincerely,
Russell Dudek
