

Interview Thesis Brief

KLDiscovery · DIRECTOR OF PRODUCT - CLIENT SERVICES TECH ENABLEMENT

Russell Dudek

INDEPENDENT CANDIDATE VISION

Pittsburgh, PA · 412.287.8640 · russelldudek@gmail.com · linkedin.com/in/russelldudek
<https://russelldudek.github.io/KLDiscovery/>

Make matter state executable.

Candidate thesis

KLDiscovery can create disproportionate leverage by defining one operational truth across workflow orchestration, anomaly detection, and client visibility. A shared Matter State Contract makes every handoff machine-actionable, every exception accountable, and every client update traceable to the work itself.

WHAT THE ROLE IS REALLY BEING HIRED TO ACCOMPLISH

Orchestrate

Replace manual handoffs and application fragmentation with explicit states, integration events, ownership, and safe automation from intake through production.

Assure

Surface quality and SLA divergence early, connect AI detection to evidence and human authority, and reduce defects before client exposure.

Reveal

Give clients real-time, comprehensible visibility into status, lineage, SLA, billing, and choices without exposing raw operational noise.

THE COMPANY MOMENT

KLDiscovery publicly positions itself around AI-driven eDiscovery tools, disciplined execution, deep domain expertise, integrated global teams, and technology-enabled client services. Its current product direction includes generative AI inside Nebula, expanding client visibility, and strengthened executive product leadership. The Director role is therefore a bridge between product ambition and the operating system that must make that ambition trustworthy at scale.

FIVE OPERATING TENSIONS

Speed vs defensibility

Automation must shorten time without weakening lineage, evidence, quality controls, or accountable release.

Standardization vs matter judgment

Common patterns must support legitimate case variation rather than erase it.

AI detection vs human accountability

Models can surface divergence; named people must still own consequential decisions.

Internal truth vs client-safe truth

The portal must translate real operating state, not reconstruct reassuring status after the fact.

Russell Dudek · 412.287.8640 · russelldudek@gmail.com
<https://russelldudek.github.io/KLDiscovery/>

The minimum record required to move work responsibly.

Contract element	Workflow use	AI use	Human authority	Client-safe use
Expected state	Defines eligibility and next step	Creates comparison baseline	Approves policy and tolerance	Sets understandable milestone
Observed state	Advances or pauses flow	Detects divergence	Validates material exceptions	Supports current status
Evidence	Proves handoff and completion	Grounds classification / evaluation	Supports release decision	Explains lineage and confidence
Owner & SLA	Routes work and escalation	Forecasts risk	Accepts accountability	Names next update and response
Authority boundary	Controls automation	Constrains agent action	Retains legal / operational judgment	Clarifies choices and approvals

OPERATING SEQUENCE

1. Define Specify expected state, evidence, owner, SLA, authority, and client-safe translation for a bounded matter archetype.	2. Observe Instrument event sources across systems and teams; make missing, conflicting, or late state visible.	3. Compare Use rules, statistical signals, and AI where appropriate to identify meaningful divergence.
4. Decide Route the exception to the correct human authority with evidence, options, and consequences.	5. Publish Translate the resolved operating state into useful client status, SLA, lineage, billing, or self-service action.	6. Learn Retain cause, action, outcome, threshold performance, recurrence, and product decision.

PRODUCT ARCHITECTURE IMPLICATIONS

- **Common state and event vocabulary:** the three flagship products cannot compound if each describes the matter differently.
- **Exception-first product design:** straight-through automation is valuable, but trust is won when divergence is detected, explained, owned, and closed.
- **AI evaluation tied to work:** precision, recall, calibration, false-negative cost, intervention rate, and business outcome must be reviewed by exception family.
- **Portal translation layer:** client visibility should be derived from operational events with disclosure rules-not a separate manual reporting workflow.

Operational excellence is a connected measurement system.

Flow

Cycle time: elapsed and active time by stage, handoff, exception, and matter archetype.

First-touch resolution: work resolved without reassignment, missing context, or duplicate intake.

Assurance

Quality rate: first-pass acceptance, escaped defects, repeated variance, and evidence completeness.

Detection performance: useful warning lead time, false positives, false negatives, and intervention rate.

Commitment

On-time SLA: forecast accuracy, milestone attainment, recovery time, and communication latency.

Client trust: portal engagement, self-service completion, escalation reason, and status clarity.

Leverage

Automation coverage: eligible work automated, safe straight-through completion, and exception cause.

Reuse: percentage of new workflows assembled from established state, integration, evaluation, and portal patterns.

DECISION RIGHTS TO ESTABLISH EARLY

Decision	Product	Operations / CS	Engineering / AI	Executive / control
State contract	Accountable for product model	Validates work reality	Validates feasibility / data	Approves enterprise boundaries
Automation eligibility	Defines value / experience	Owens operating exception	Implements controls	Approves material risk policy
AI threshold	Owens product outcome	Defines intervention cost	Owens model evaluation	Approves high-consequence use
Client disclosure	Designs translation	Owens communication context	Supplies trusted events	Sets legal / commercial rules

STAKEHOLDER COMPACT

Product owns the coherent outcome and roadmap. **Operations and Client Services** own work reality, matter judgment, and adoption. **Engineering and the AI Architect** own safe, supportable implementation and evaluation. **Quality, Security, Legal, and Finance** define non-negotiable controls and economic truth. **Clients** validate whether visibility reduces effort and increases trust.

Immediate contribution and domain ramp

Russell does not substitute adjacent operating experience for eDiscovery expertise. He contributes immediately in workflow productization, high-consequence quality systems, AI-enabled process design, technical translation, instrumentation, customer-backward operations, and cross-functional execution-while learning matter mechanics directly through shadowing, operator interviews, product architecture review, and explicit decision-right mapping.

Use the interview to locate the highest-leverage operating truth.

EXECUTIVE QUESTIONS

1. Where do client expectations and the current internal matter state diverge most often-and how is that learned today?
2. Which handoffs create the highest combination of cycle-time drag, defect risk, and client escalation?
3. Which anomaly families are well understood operationally but poorly instrumented technically?
4. What authority must remain with matter teams as orchestration and AI mature?
5. What is the intended relationship among the workflow platform, anomaly infrastructure, Nebula, the Client Portal, and existing enterprise systems?
6. How do Product, Client Services, Operations, Engineering, and the AI Architect currently split outcome ownership?
7. Where does application consolidation create the greatest risk of disrupting service continuity?
8. What would make this role an unmistakable twelve-month success?

EVIDENCE TO DISCUSS

Vape-Jet

Current cross-functional AI-first operating transformation spanning production, quality, customer, support, engineering issue flow, ERP, CRM, collaboration, and telemetry.

Compunetics

High-consequence engineering, manufacturing, quality, root-cause, process-control, and customer-delivery mechanisms.

Amazon

Customer-backward launch, 24/7 throughput, standard work, escalation, and high-velocity service execution.

DudeWorth

AI workflow, RAG, agent, human-authority, evaluation, governance, and value-realization design.
